

Wall mounted earth loops

The wall mounted earth loops are installed onto the wall protecting the bottom wires on a wall top fence.

They are used to enhance the level of security offered by an electric fence by detecting attempted separation of fence wires and leaving just enough room for natural movement of the live wire. When the earth wire touches the loop a connection is made and the alarm will sound.

They are available in stainless steel, angled or straight to marry up to the type of Nemtek bracket used.

Specifications:

-304 Stainless steel finish

-Angled or straight
